Sajan's Case Study

Project Background

To eliminate the need for full translation and limit it to MT + Post-editing

Global Multinational on the IT domain

Client has its own proprietary MT system

Achieved 60% reduction in costs and 77% time savings

Business of Integrating MT into process

Setting Quality Expectations and pre-requisites for achieving high quality outputs

Supply Chain focus on Post-editing with instructions – Post-Editors vs Translators

New Pricing Models – the higher the volume the more beneficial

Managing entire workflow via GCMS

Technology Integration

Volumes and data preparation: many millions and high quality data: TMs, Glossaries, Style Guides and Lists of DNTs

Automation: workflow integration, conversion (client proprietary xml and conversion to / from xliif)

Managing the incremental training requirements: higher volumes + higher quality data = better results over time

Project Details

27 million words have been processed by this client in the MT space

Since last October Sajan and Asia Online have processed many million words through MT for this client in European Spanish and Traditional Chinese

Improved the BLEU scoring against the client's own MT output by 5 points - significant quality improvement – 65 BLUE score = human quality output

Chinese scored better than first pass human translation as per client's feedback

Client extremely impressed with result especially when compared to the output of their own engine

Result = Client has commissioned us to work into more languages
